# streaming-file-server (4.3.29)

Maksim Kostromin

Version 4.3.29, 2019-10-19 13:11:14 UTC

## **Table of Contents**

1. Introduction	2
2. Installation	3
2.1. download files	3
3. Run	
3.1. postgres database	4
3.2. in-memory h2 database	4
3.3. take advantages of spring-boot executable jar	4
4. Usage scripts	5
4.1. simplicity bootstrap with automation shell-script	5
4.1.1. unix (bash)	5
4.1.2. windows (batch cmd)	5
5. Create new release	7

Documentation in PFD format is located:

## Chapter 1. Introduction

Streaming file server — java based project on top of spring-boot. This is a simple file-server which is allowed upload and download files with no memory limitation. It uses file multipart protocol

## **Chapter 2. Installation**

### 2.1. download files

if you have docker installed and wanna use postgres, then download docker-compose.yml file

wget https://github.com/daggerok/streaming-fileserver/releases/download/4.3.29/docker-compose.yml

#### file items service

wget https://github.com/daggerok/streaming-file-server/releases/download/4.3.29/fileitems-service-4.3.29.jar

#### file server

wget https://github.com/daggerok/streaming-file-server/releases/download/4.3.29/file-server-4.3.29.jar

## Chapter 3. Run

### 3.1. postgres database

install using postgres in docker

```
# docker compose file for postgres database
docker-compose up -d

# file-items data service
java -jar file-items-service-4.3.29.jar --spring.profiles.active=db-pg

# file server
java -jar file-server-4.3.29.jar --app.upload.path=./path/to/file-storage

# cleanup
docker-compose down -v
```

### 3.2. in-memory h2 database

if you do not have docker—feel free to use h2 in memory database for file items service:

```
java file-items-service-4.3.29.jar
# or
java file-items-service.jar --spring.profiles.active=db-h2
```

and then run file server:

```
java file-items-service-4.3.29.jar --spring.profiles.active=db-h2
```

### 3.3. take advantages of spring-boot executable jar

if you are using bash—run even simply

```
wget https://github.com/daggerok/streaming-file-server/releases/download/4.3.29/file-
items-service-4.3.29.jar
bash file-items-service-4.3.29.jar

wget https://github.com/daggerok/streaming-file-server/releases/download/4.3.29/file-
server-4.3.29.jar
bash file-server-4.3.29.jar --app.upload.path=./path/to/file-storage
```

## Chapter 4. Usage scripts

### 4.1. simplicity bootstrap with automation shell-script

#### 4.1.1. unix (bash)

postgres in docker

```
# get
wget https://github.com/daggerok/streaming-file-
server/releases/download/4.3.29/application.bash

# start
bash application.bash start ./path/to/file-storage

# stop
bash application.bash stop

# cleanup
bash application.bash clean ./path/to/file-storage
```

download: application.bash

h2 in-memory database

```
# fetch
wget https://github.com/daggerok/streaming-file-
server/releases/download/4.3.29/application-h2.bash

# start
bash application-h2.bash start ./path/to/file-storage

# stop
bash application-h2.bash stop

# cleanup
bash application-h2.bash clean ./path/to/file-storage
```

download: application-h2.bash

note: binaries wget, docker-compose and of course jre (binaries: java and jps) are required

### 4.1.2. windows (batch cmd)

#### postgres in docker

```
@rem start
application.cmd start path\to\file-storage

@rem stop
application.cmd stop

@rem cleanup
application.cmd clean path\to\file-storage
```

download: application.cmd

*h2 in-memory database* 

```
@rem start
application-h2.cmd start path\to\file-storage

@rem stop
application-h2.cmd stop

@rem cleanup
application-h2.cmd clean path\to\file-storage
```

download: application-h2.cmd

note: binaries wget, docker-compose and of course jre (binaries: java and jps) are required

## Chapter 5. Create new release

to create new release do next

- 1. bump version in (better use IDE find and replace functionality):
  - a. build.gradle
  - b. README.md
  - c. scripts/application.cmd
  - d. scripts/application.bash
  - e. scripts/application-h2.cmd
  - f. scripts/application-h2.bash
- 2. exec bash mvnw command to create new release
- 3. commit amend and push
- 4. check CI if builds was successfully passed
- 5. update created release page on github according last changes
